Epithelial Mesenchymal Transition (EMT) is a reversible process that triggers the loss of epithelial cell features, such as apico-basal polarity and intercellular adhesions, along with the gain of mesenchymal characteristics, including cytoskeletal rearrangements, individual migratory ability and invasiveness. In addition to its roles in embryo development and organ formation, EMT is involved in pathological conditions, such as wound healing, tissue fibrosis and cancer. EMT is controlled by hierarchically organized transcription factors (EMT-TFs) belonging to multiple classes of nuclear proteins, such as Zn finger (SNAIL1, SNAIL2/SLUG, ZEB 1 and ZEB2/SIP1) and bHLH (TWIST1 and TWIST2) families.

In response to ectopically re-expressed EMT-TFs, EMT is involved in the key steps of metastatic colonization. TGF-beta, secreted by both autocrine and paracrine mechanisms often mediated by cancer-stromal cell interactions at the invasive front of tumors, is one of the major inducers of tumor-associated EMT.

My group is currently studying the EMT controlled by the AP-1 complex and specifically the FOS-family component FRA-1, recently implicated in metastasis mechanisms. My interest for the AP-1 oncoproteins began long time ago, when I was a post-doctoral fellow in Francesco Blasi’s laboratory, while studying the transcription factors controlling the human urokinase gene (PLAU) in response to oncogenic signals. In the meanwhile, starting from the identification of the nuclear factors cooperating with AP-1 in the control of the PLAU enhancer, Francesco Blasi has undertaken a highly successful all-round study of PREP1, a TALE family transcription factor.

The TALE (Three Aminoacids Length Extension) homeodomain subfamily includes 4 Pbx, 3 Meis and 2 Prep/Pknox genes. Blasi and collaborators have investigated all major biological roles of PREP1 in mouse models and in vitro cell systems. In addition to studying various aspects of PREP1 in mouse development, Francesco Blasi has recently characterized PREP1 as a haploinsufficient tumor suppressor.
suppressor involved in both hematopoietic and solid tumorigenesis. In addition to delucidating the PREP1 role in maintinance of genome stability, Francesco Blasi, in collaboration with Miguel Torres (CNIC, Madrid), has delucidated the mechanisms of target site selection by the dimeric TALE homeoprotein complexes, by genome-wide analyses of the PREP1/PBX1/MEIS1 DNA-binding profiles. Importantly, Blasi and coworkers have recently shown how PREP1 oncosuppressor activity results from the PREP1 competition with the MEIS1 for PBX1 binding, affecting the MEIS1 stability and tumorigenic activity.

By identifying the PREP1 transcript as a target of miR-19a, belonging to the miR-17-92 oncomir cluster, my group had previously stumbled upon PREP1. To understand the significance of the the miR-19-mediated regulation of PREP1, we analyzed the effects of PREP1 in NSCLC cell lines. When my PhD student Maurizio Risolino, observed striking morphological changes in PREP1-overexpressing cells, I had a great occasion to start a new collaboration with Francesco Blasi, many years after the PLAU enhancer story. Francesco enthusiastically agreed with our incursion into his preferred gene product, and hosted my PhD student Nadia Mandia for a short but fruitful stay in his laboratory at IFOM.
By investigating various EMT markers along with cell motility and invasion, Risolino, *et al.* showed that the observed modifications reflected the mesenchymal transition triggered by PREP1. Mechanistic analysis revealed that PREP1 positively controls the TGF-beta-SMAD pathway, with an effect at least partially mediated by PREP1-mediated transactivation of SMAD3. PREP1, in addition causes the accumulation of its heteromeric partner PBX1 and of the FRA-1 oncoprotein, both required for the PREP1-induced mesenchymal transition.

Lung colonization assays revealed that PREP1-overexpressing cells, but not the poorly invasive control (A549) cells, gave rise to lung nodules. Accordingly, in collaboration with Michel Mittelbronn (Frankfurt Medical School), PREP1 accumulation was detected in a large number of human brain metastases of solid tumors, including NSCLC. These findings seem to contradict the previously reported tumor suppressor role of PREP1. Such discrepancy, however, is only apparent, since, differing from lung nodules, the PREP1-overexpressing xenografts exhibited decreased growth. Thus, PREP1 seems to play a dual function that might reflect the dual role (antiproliferative vs pro-metastatic) of the TGF-beta pathway in tumorigenesis. While a previous report from Michael Cleary’s group, based on the analysis of Pbx1 knockout mice, had suggested the possible role of Pbx1 in the responses to TGF-beta, Risolino *et al.* provided the first evidence on the involvement of human PREP1 in EMT and metastasis, by TGF-beta-SMAD-dependent mechanisms.

Therefore, thanks to the open mind and generosity of Francesco Blasi, our fruitful collaboration resulted in the identification of a novel player in the complex network of transcription factors implicated in EMT.
Pasquale Verde
Research Director at the CNR Institute of Genetics and Biophysics, Naples

Pasquale Verde graduated in Medicine (1981, University of Naples Federico II) with an experimental Thesis on transcriptional control in prokaryotes (Regulation of the His operon in *E. Coli*). Pasquale Verde has been a post-doctoral fellow in the laboratory of Francesco Blasi, where he worked on the transcriptional regulation of the human urokinase gene, at the CNR International Institute of Genetics and Biophysics (Naples), where he was appointed as Researcher in 1984. During 1986-1987 he moved as Visiting Fellow at the Columbia University Comprehensive Cancer Center (NYC, NY), directed by Dr. ME Gottesmann. Since 1992, as group leader at CNR IIGB, he has been studying multiple aspects of the AP-1 complex in neoplastic transformation, with recent focus on the transcription factor FRA-1. Presently, he is CNR Research Director and his research interests are focussed on the regulatory interactions between transcription factors (FRA-1, TALE homeproteins, p53) and miRNAs in epithelial-mesenchymal-transition and neoplastic transformation.

PREP1: a TALE of transcription factors, EMT and metastasis
